In biomembranes, the ethanolic extract of Hybanthus enneaspermus has been extensively worked out. Previously reported that the chosen plant having alkaloids, flavanoids, tannins, cardio glycosides, saponins, and terpenoids like compounds in Hybanthus enneaspermus. Hence in the present study, an attempt has been made to create an animal model with oxidative stress using CCl_4, create an animal model with oxidative stress using C

**ABSTRACT:**

In this present study, we evaluated the liver mitochondrial membrane ATPases activities on carbon tetrachloride induced oxidative stress in rats. Wistar strain male albino rats were divided into four groups. Group I animals were served as normal and group II was administrated with corn oil as vehicle control. Group III was given single dose (25th day) of CCl_4 in corn oil (1:1 v/v, 3ml/kg, i.p.). Groups IV was treated with ethanolic extract of Hybanthus enneaspermus. (Orally at the dose of 500mg per kg body weight). In CCl_4 + Hybanthus enneaspermus treated rats, Na^+/K^+ATPase, Ca^{2+}ATPase and Mg^{2+}ATPase activities were attained normally when compared with CCl_4 treated rats.

**KEYWORDS:** Oxidative stress, Carbon tetrachloride, Hybanthus enneaspermus, Na^+/K^+ATPase, Ca^{2+}ATPase and Mg^{2+}ATPase activities were evaluated.

**INTRODUCTION:**

In biomembranes, Molecular interactions play a bottom-line role to communicate the cells and signal transduction pathways. Membrane receptors serve as the main targets able to recognize specific ligands selectively, which can trigger a cascade of functional cell responses. Biological membranes are the first fence that has to be overcome by toxic compounds targeting the cell. One of the most important membrane proteins is adenosinetriphosphatase (ATPase, EC 3.6.1.3), an integral part of a sodium-potassium pump and the largest protein complex member of P-type family of active cation transport proteins. ATPases play an important role in the maintenance of Ionic gradient by coupling ATP hydrolysis with energy process. ATPases decomposes the adenosine triphosphate into adenosine diphosphate and a free phosphate ion. Na^+/K^+ATPase is a membrane bound enzyme and inactivation of this enzyme leads to produce oxidative stress. The rabid metabolic nature of cc14 is highly induces the toxicity when it is administrated into living things. CCl_4 is bio transformed by the cytochrome P_450 is an isoenzyme in endoplasmic reticulum to convert CCl_4 into trichloromethyl radical (CCl_3^*) in the liver after the initiation of lipid peroxidation. CCl_3^* reacting with oxygen of cellular proteins and lipids to produce a trichloromethyl peroxyl radical which attacks rabidly lipid membrane of endoplasmic reticulum than trichloromethyl free radical. It has been leads to liver cirrhosis, aging, reduced glutathione, accumulation of triacyl glycerol, Ca^{2+} and Na^{+} influx and finally cell swelling in mitochondria which allows the mitochondrial membrane damage, reduced carbonylation of protein, loss of enzyme activity and cell death. This result in changes of structure of the endoplasmic reticulum and other membrane, and loss of glucose-6-phosphatase activation, leading to liver damage. The medicinal value of the chosen plant Hybanthus enneaspermus has not been extensively worked out. Previously reported that the chosen plant having alkaloids, flavanoids, tannins, cardio glycosides, saponins, and terpenoids like compounds in Hybanthus enneaspermus. Hence in the present study, an attempt has been made to create an animal model with oxidative stress using CCl_4 and the ethanolic extract of Hybanthus enneaspermus on liver mitochondrial membrane Na^+/K+ATPase, Ca^{2+}ATPase and Mg^{2+}ATPase activities were evaluated.

**MATERIALS AND METHODS:**

**Plant material and preparation of extract**

Whole plants of *H. enneaspermus* were collected in the month of November and December from PRIST University Campus, Thanjavur, Tamil Nadu, India. The collected plants were identified and authenticated by a Botanist Dr. John britto, Department of Herbarium, St.Joseph college, Trichy, Tamil Nadu, India. The collected plants were open-air-dried under the shade, pulverized in to a moderately coarse powder (using pestle and mortar). Three-hundred grams (300 g) of the powered plants were extracted with ethanol (70%) using soxhlet apparatus for 48 h. A semi-solid extract was obtained after complete elimination of alcohol under reduced pressure. The extract was stored in refrigerator until used. The extract contains both polar and non-polar phytocomponents.

**Animals:** Wistar strain male albino rats, weighing 180-200 g were selected for the study. The animals were housed individually in polypropylene cages under hygienic and standard environmental conditions (28±2°C, humidity 60-70%, 12 h light/dark cycle). The animals were allowed a standard feed and water _ad libitum_. They were acclimatized to the environment for 1 week prior to experimental use. All the animal experiments were duly approved by the Institutional Animal Ethics Committee (743/03/abe/CPCSEA dt 3.3.03) Guidelines. (IAEC)

**Induction of oxidative stress:** Oxidative stress through hepatic injury was created by intraperitoneal injection of CCl_4 in corn oil (1:1 v/v, 3ml/kg). The control animals received vehicle alone through intraperitoneal injection.

**Experimental protocol:** Rats were divided into four groups with six animals in each group. Group I animals were served as normal control. Group II was administrated with corn oil (3ml/kg, i.p.) as vehicle control. Group III was given single dose (29th day) of CCl_4 in corn oil (1:1 v/v, 3ml/kg, i.p.). Groups IV was treated with (5E, 13E)-5,13-Docosadienoic acid (6 mg/kg body weight) for 28 days and given single dose of (29th day) CCl_4 in corn oil (1:1 v/v, 3 ml/kg, i.p.). Six hours after CCl_4 intoxication, the experimental animals were sacrificed. The blood was collected with EDTA as
anticoagulant. Serum was separated by centrifugation. Liver was excised immediately and immersed in physiological saline. It was suspended in 10% (w/v) ice-cold 0.1 M phosphate buffer (pH 7.4) and cut into small pieces. The required amount was weighed and homogenized using a Teflon homogenizer. Tissue homogenate and serum were used for the estimation of various biochemical parameters.

**BIOCHEMICAL ANALYSIS**

ATPases:
The mitochondrial homogenate was used for assaying membrane bound enzymes like Na⁺/K⁺-ATPase, Ca²⁺-ATPase, and Mg²⁺-ATPase, activities. The amount of inorganic phosphorous was determined by the method of Fiske and Subbarow. Protein was estimated by the method of Lowry et al.

**Oxidative stress** can be defined as a disturbance in the antioxidant/antioxidant balance and it is associated with more than hundred diseases such as arthritis, carcinogenesis, and aging and acquired immunodeficiency syndrome. The number of organic compounds and inorganic salts, including cardiovascular and anti-cancer drugs, biologically important elements, heavy metals, organic solvents and some toxic organic compounds, such as pesticides and herbicides, strongly modulate enzyme activity on the concentration dependent manner. Because of its high sensitivity to the broad spectrum of toxic compound, as well as potential cardiotoxic and anticancer drugs, Na⁺,K⁺-ATPase activity can be taken as meaningful index of cellular activity and forms a useful toxicological tool in medicine, pharmacy and environment. In conclusion, the restored activities of liver mitochondrial Na⁺/K⁺-ATPase, Ca²⁺-ATPase and Mg²⁺-ATPase were observed after treatment with CCl₄ and *Hybanthus enneaspermus* rats and thus the results proved that the *Hybanthus enneaspermus* extract have strong membrane stabilizing action.

**STATISTICAL ANALYSIS:**
Statistical analysis values were expressed as mean ± SD for six rats in the each group and statistical significant differences between mean values were determined by one way analysis of variance (ANOVA) followed by the Tukey’s test for multiple comparisons. Statistical analysis carried out by Ms-Window based graph pad Instat software (Graph Pad Software, San Diego, CA, USA) 3 version was used. A value of p < 0.001 was considered statistically significant.

**RESULTS AND DISCUSSION:**
The activity levels of mitochondrial Na⁺/K⁺-ATPase, Ca²⁺-ATPase and Mg²⁺-ATPase in liver was studied after inducing oxidative stress by using CcI₄ as a toxic inducer. All three ATPases showed conspicuous inhibition in CcI₄ induced oxidative stress rats. In *Hybanthus enneaspermus* treated rats restored the levels of Na⁺/K⁺-ATPase, Ca²⁺-ATPase and Mg²⁺-ATPase in liver (Table 1).

Oxidative stress is mainly caused by the mitochondrial dysfunction and energy depletion and alteration in the ionic homeostasis leads to loss of cellular integrity and cell death. Oxidative stress can be defined as a disturbance in the proxidant/antioxidant balance and it is associated with more than hundred diseases such as arthritis, carcinogenesis, and aging and acquired immunodeficiency syndrome. The number of organic compounds and inorganic salts, including cardiovascular and anti-cancer drugs, biologically important elements, heavy metals, organic solvents and some toxic organic compounds, such as pesticides and herbicides, strongly modulate enzyme activity on the concentration dependent manner. Because of its high sensitivity to the broad spectrum of toxic compound, as well as potential cardiotoxic and anticancer drugs, Na⁺,K⁺-ATPase activity can be taken as meaningful index of cellular activity and forms a useful toxicological tool in medicine, pharmacy and environment. In conclusion, the restored activities of liver mitochondrial Na⁺/K⁺-ATPase, Ca²⁺-ATPase and Mg²⁺-ATPase were observed after treatment with CCl₄ and *Hybanthus enneaspermus* rats and thus the results proved that the *Hybanthus enneaspermus* extract have strong membrane stabilizing action.
